**Organiser's Notes**

Thanks to Chris Embrey for relocating #10 in the correct position. Learning point for me is "if you put the controls out in the dark and from a different direction from the check visit then don't just assume that your tape as gone missing". If Chris thinks he lost more than 4 minutes 42 seconds because of my mistake we may need to revisit the league points.

It is important to that we have a good time and I don't like forcing competitors to make a "which shall I miss out" decision until they have had an opportunity to assess their speed/accuracy/reliability against the terrain. My experiment "bring the course past the finish part way round and then also have lots of controls near the finish right at the end" seems to have been appreciated but I suspect that it might not have been entirely fair. I did not expect so many folks to chose to omit so many of the early controls.

Technically Alison's score should be 20 control points - having visited number 20 first and then remembering that it was not a score event and starting again with 1,2,12 etc. in proper sequence. Unless one of the other competitors protests I propose to let Alison's 100 control points/23 league points score stand.

Richard's time is impressive – on my #daylight# test run I took 44 minutes – though my route choice was conservative (bramble and climb averse) and my forward progress was impeded by a particularly young and bouncy pointer.
